

Wine API

Docker Container

First Build the Docker Container (just executing build.bat should work, if not try order below)

- execute `build.bat`
- execute `update-database.bat` (note: Connection error might pop up, can be ignored. if test data isn't in database, run this again!)
- execute `build.bat`
- (execute `run.bat` file) (not needed after build, since container is running)

Afterwards; you only need to run it via the bat file or in docker.

- execute `run.bat` file
- enjoy!

Database

- open `http://localhost:8080/` for [Adminer](#)
- Credentials:
 - System : PostgreSQL
 - Server : db
 - Username : wineAdmin
 - Password : 12345678
 - Database : WineDb

Swagger

- open `https://localhost:80/swagger` for [Swagger](#)

How to use the Api

- Login with a user
- Default User:
 - testUser1@gmail.com
 - password123
- Admin User:
 - admin
 - admin
- You'll get a jwt Token in return
- Use that to authorize further requests!
